WORLD HISTORY

Crash Course: Columbian Exchange

Name	
Use link on homework website	

Before, we couldn't really talk about a world history	
histories of separate regions, but change	ed all of that, and everything else. The Columbian
Exchange irrevocably homogenized the world's biological landscape. Sin	
species has continually diminished, and the variation in species from place	
the first European visitors to the Americas had never seen a	or a catfish; Native Americans had never
seen a, and by making our planet biologically s	singular, the Columbian Exchange completely
remade the populations of animals, particularly humans. And vitally, this	cross-pollination also made possible such wonders
as contemporary pizza.	
So we're going to break the Columbian Exchange down into four categorie I'm glad you've been eliminated; Animals, Plants, and People.	es: Diseases, boy, you're looking good Smallpox,
Past John Green: Mr. Green, Mr. Green! People are animals. Present John the sake of simplicity we're	hn Green: Yeah, that's true, me from the past, but
Past John Green: Also, when you think about it, microbes are kinda anima	als and plants are, too, I meanPresent John
Green: Oh my god, shut up before I kill you and create a time travel parad	lox.
Microbes, like those hairy blokes back there, were a definite negative in te	erms of the Columbian Exchange. Terminology is
hard here, but the majority of Caribbean Islanders or Native Americans or	Amerindians had exactly one response to the
arrival of Europeans:	
We can't be sure of how many natives died as a result of European arriva	l but it was definitely more than % and
some estimates place it as high as%. Historians used t	
factor, but the main culprit was	, , , ,
Smallpox is usually seen as the villain of the story but it is more likely that	a series of diseases in combination did the
damage. Along with smallpox, Americans were killed by	
, none of which they had been prev	viously exposed to. This astonishing decrease of
population was definitely the worst effect of these diseases, both psychological	
But the secondary effects were almost as bad. For one thing the deaths of	of Aztec and Incan rulers touched off wars which
made it easier to spread disease, because you know, the number one wa	
Plus leaders kept dying. Huayna Capac, the leader of the Incan empire, s	succumbed to smallpox before Pizarro even
arrived. His death led to a violent succession struggle between his sons v	
captured and killed by Pizarro. And without that war, the Inca would have	
whose numbers were comparatively tiny. A similar thing happened to the	
Cortés was the nephew of a much more powerful king who died of smallp	
some of the smaller states in the Aztec empire to rebel, and some of them	
Another effect of disease was, because	se there simply weren't enough people left to grow
Another effect of disease was, because crops to feed the living. And the malnutrition made survivors that much much much made survivors that much much much much much much much much	ore susceptible to disease. In short, it sucked.
	•

The transmission of disease largely went one way, from the Old World to the New, but the Americans did have one gift for Europe: venereal syphilis. It showed up in Europe around 1493, and even though Europeans are very fond of ascribing syphilis to each other: Italians called it the French disease; the French called it the disease of Naples; Poles called it the German disease; Russians called it the Polish disease. The truth is, venereal syphilis was spread by sailors who'd returned

from the Americas.

In fact, in his book, The Columbian Exchange, Crosby tells it like this: "Sailors, by the nature of their profession, are men without women and therefore men of many women. We can imagine no group more perfectly suited for guaranteeing that venereal syphilis would have worldwide distribution." Who says history books are boring? Syphilis would go on to infect a veritable who's who of Europe: from Baudelaire to Gauguin to Nietzsche, not to mention numerous family members of the famously infertile Tudor and Valois families, meaning that syphilis may be responsible for many of those miserably boring dynastic power struggles of post-Columbus Europe. Anyway, nothing against syphilis, but it pales in comparison to the devastation wrought by Old World diseases arriving in the New World.

But the New World did have one gift for the Old World that was pretty destructive:
Oh, it's time for the open letter and there's been a costume change? T hat doesn't bode well.
An Open Letter to Tobacco. Dear Tobacco, I just did something really stupid but at least it was cheap. I'm gonna tell you two stories about smoking, the first come from my high school history teacher Raoul Meyer who also writes Crash Course. When I was a senior in high school he walked up to me and he said, "I want you to keep smoking. I want you to smoke until the day after your 65th birthday, and then I want you to die so that I collect all of your social security." That inspired me, Mr Meyer, to quit smoking just eight short years later.
Here is an amazing statistic: were handed out to American servicemen during World War II and more soldiers who started smoking during the war died from than died from the
So if the New World was looking to extract some measure of revenge for smallpox, and measles, and chicken pox: Mission accomplished. Best Wishes, John Green
Now onto animals. American animals, like llamas and guinea pigs, never really caught on in Eurasia. But imports to the Americas, like pigs, cows and horses were revolutionary. Let's go to the thought bubble:
First of all, these animals, especially, completely remade the food supply. Pigs breed really quickly, they eat anything and they turn into bacon, which made them heroes to the new world just as today they are heroes to the internet. Here's how quickly pigs breed:
When arrived in in 1539, he brought 13 pigs. By the time of his death, there were 700 - that was 3 years later. The abundance of meat and plentiful land for agriculture and grazing meant that Europeans in the Americas very rarely experienced famine, and despite what you may have learned about religious and political freedom, the main reason Europeans came to America was to eat.
Large European animals also changed the nature of work in the Americas. Before Europeans, the largest beast of burden was the llama, and at best it could carry like, 100 lbs. This meant that for the long distance travel that the Inca engaged in, the primary transportation animal was Incas, when combined with their plows, made it possible to bring more land under cultivation and also made transportation easier and more efficient, and plus European animals remade culture.
The grossly stereotypical American Indian, like from the movies, riding the Great Plains with an eagle feather headdress and war paint, well he didn't exist before the Columbian Exchange because there were no horses for him to ride. And the introduction of horses allowed many Native Americans to abandon agriculture in favor of a nomadic lifestyle because riding around hunting made them far richer than farming ever had. Thanks Thought Bubble. While animals and diseases completely reshaped the New World, it was New World that had the biggest effect on Eurasia.

Sure, Europeans brought over some crops that we now grow here in the Americas like wheat and grapes, both of which are necessary for Catholic mass, but New World plants radically changed the lives of millions, maybe hundreds of millions of Africans, Asians and Europeans, specifically by making pizza possible.
I mean until 500 years ago, Italians lived without, without modern pizza or marinara sauce or pizza or ketchup or pizza or even pizza. Indians lived without curry, which contains chilies, a New World food. Persians lived without, which is a New World food, as are beans and potatoes and avocados and peanuts and blueberriesthe list goes on and on.
And these New World crops led to probably the greatest increase in history. To quote Crosby, "It is crudely true that if man's caloric intake is sufficient, he will somehow stagger to maturity, and he will reproduce."
And New World food was far more caloric than Old World food, which is the central reason that the world population doubled between 1650 and 1850. Plants like corn and potatoes could grow in that were useless for Old World crops. Potatoes were actually introduced to Europe as an aphrodisiac, but it turns out that you have to distill those potatoes into vodka before they have the desired effect. Anyway, if potatoes are an aphrodisiac, the Irish quickly became the hottest people on Earth.
An acre and a half of potato cultivation could feed an Irish family for a, and the average Irish worker often ate, bs. of potatoes every day. Surviving primarily on potatoes, the Irish more than doubled their population between 1754 and 1845, when the Potato Famine showed up and ruined everything.
And it wasn't just Europe. Manioc, or cassava is a New World plant with roots that provide more calories than any other plant on Earth, provided they are properly processed (otherwise they're poisonous). Manioc is so prevalent in Africa that many Africans swear that the plant is native to the continent, but it isn't.
Nor are potatoes, and while New World grains never replaced rice in Southeast, or East Asia, the sweet potato was so common that it is known as the "poor person's staple" in China. Even in Japan, the tomb of the farmer who is reputed to have first brought them to the islands is known as the Temple of the Sweet Potato. And it's also worth noting that corn, while it may not feature prominently in European diets, has been the central source of food for animals in Europe for centuries. And in fact, that's still the case. In 2005,% of the corn grown in America went to feedis the kind of thing you learn when you live in Indiana.
Alright, so last but not least, the Columbian exchange involved the transfer of lots of people. Again, in the early stages this movement was mostly one way, with Europeans and Africansthe Africans usually against their will - making their way to the Americas.
So the Columbian Exchange led to the of the New World following the disease devastation of the initial encounter. And better nutrition allowed the population of the Old World to grow which in turn placed population pressure on which led to more people coming to the Americas. In the process, the world's human inhabitants became more genetically and ethnically interconnected. But it also led to the horrors of Atlantic, which we'll be discussing next week.
What are we to make of the Columbian Exchange? It devastated the population of the Americas, it led to the widespread slavery of Africans, but it also allowed for a worldwide population increase and the lives of some Natives including Plains tribes like the Lakota became better and more secure, at least for a while.
people have starved since the Columbian Exchange began, but the diversity of life on Earth has diminished dramatically and planting crops where they don't belong has hurt the environment. So on the whole, should we be grateful for the Columbian Exchange? And should we work to continue and deepen its legacy of globalism and monoculture?

Crosby	think we were better off. "The Columbian Exchange has included man, and he has
changed the Old and New Worlds	sometimes inadvertently, sometimes intentionally, often brutally. It is possible that he and
the plants and animals he brings v	ith him have caused the extinction of more species of life forms in the last four hundred
years than the usual processes of	evolution might kill off in a million The Columbian Exchange has left us with not a richer
but a more impoverished genetic	ool. We, all of the life on the planet, are the less for Columbus, and the impoverishment
will increase."	

ESSAY (Write Answer Below)

But let's give you the last word today: Do you agree with Crosby? Are longer, healthier lives for more humans worth the sacrifice of an impoverished biosphere? And most importantly, how will your conclusions about those questions shape the way that you live your life?
